Transfer is a file transfer application that also happens to be an application with an excellent interface. It offers a streamlined and user-friendly interface that is offered to users within a wide range of categories. It provides both the FTP, FTPS, SFTP and SSH protocols. Therefore, it is accessible to users of different operating systems, including Mac OS X, Linux and Windows. Its main window is divided into four sections, and each of these sections contains a set of controls that are provided for the user's convenience and the quick execution of the tasks that are required. Within the top section, the user can select the protocol to which the transfer will be made. Below that, it is possible to see a list of the connected network locations. People also have the option of selecting whether they want to have access to the remote network locations without any restrictions. Selecting a specific network location displays a list of the local drives, where there are available paths to be able to select. Each one of these paths will be revealed to the user once they click on them. The user can then take a look at the files available for browsing, as well as the specifications of the subfolders and directories. Considering this aspect, it is also possible to select specific folders within the network location and preview the contents of those subfolders. On the left side of the interface, the user is provided with an option for launching the application's primary purpose, which is to perform the actual transfer. People can set the number of the file transfers that will be performed, as well as the time limit within which the transfers should take place. People can also set up a remote computer that will be used for the file transfer and choose the preferred settings, based on whether they want to perform the transfer manually or by using the batch mode. There are also a couple of options for the user to select on the right side of the interface. Firstly, the user will be able to select whether they want to have access to the details of the network connection. This will let the user see the current transfer rate, as well as the established time limits. Also, people will be able to select the method that will be used in the downloading, based on the selected protocol. In case people are using the batch mode, they can also select the name of the file that will be used for the transfer. Lastly, people can also choose whether they want to enable the password protection for the transferred files. In order to
